

Human-Robot-Food Interaction*

Henny Admoni, *Member, IEEE*

Cooking is a uniquely human activity. Thus, robot cooking competitions should include challenges that integrate humans. In this talk, I divide the process of cooking (and eating) into four phases, and introduce a challenge in each phase that involves human-robot interaction. By integrating human interaction into cooking competitions, I posit that we can drive forward research, expand real-world applicability, and increase public interest in our work.
